    (fc): Linear(in_features=512, out_features=10, bias=True)  
)
```

Problem 2:

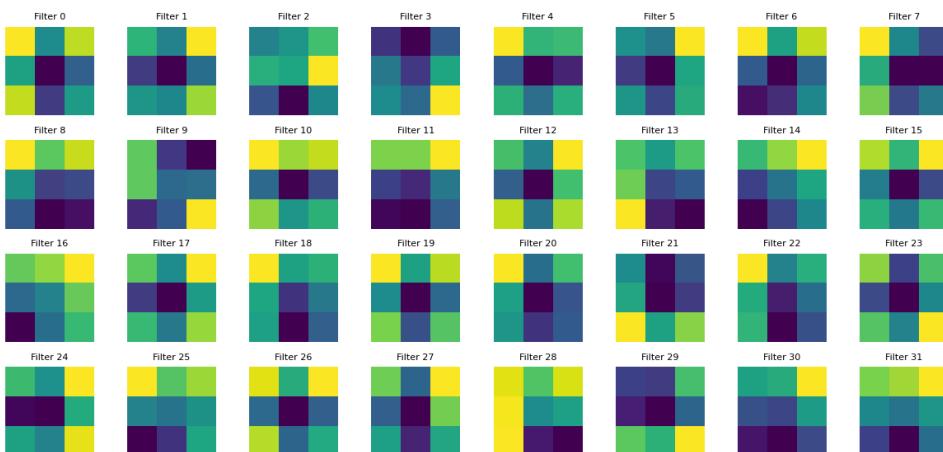

- Initial Conv layers

First Conv Layer (conv1) - 7x7 RGB Filters

- Final conv layers (average because of 512 channels)

Final Conv Layer (layer4.1.conv2) - 3x3 Filters (channel mean)

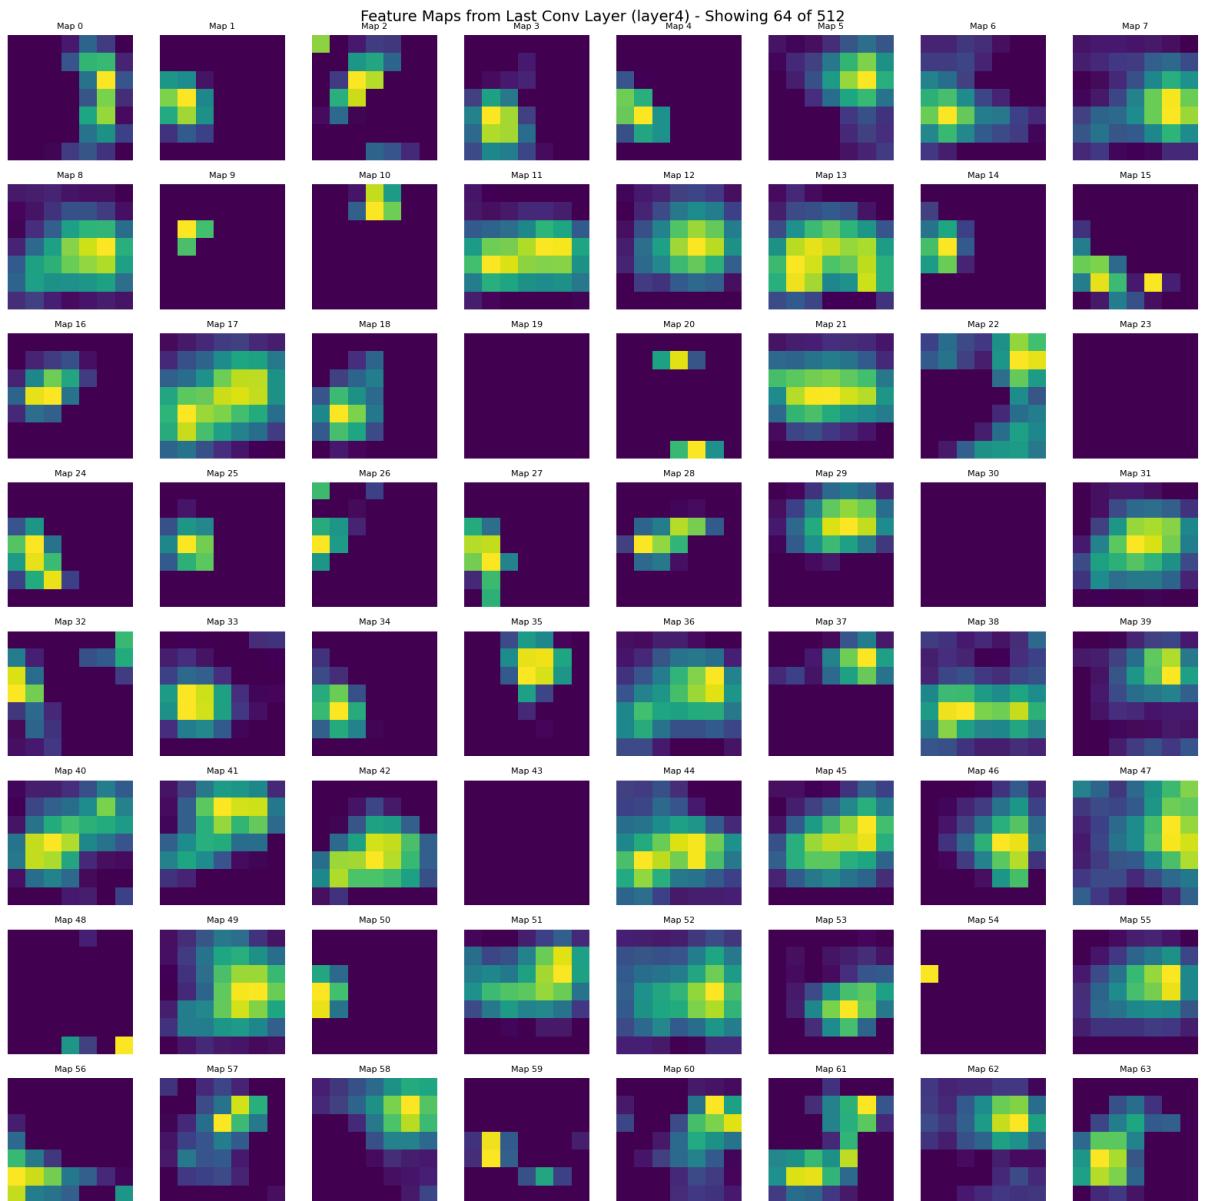

Problem 3:

- Original Image

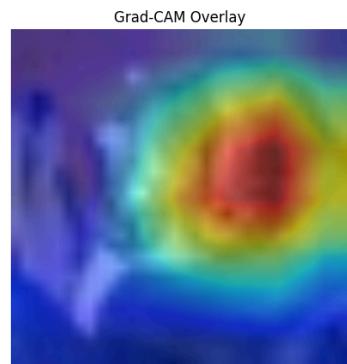

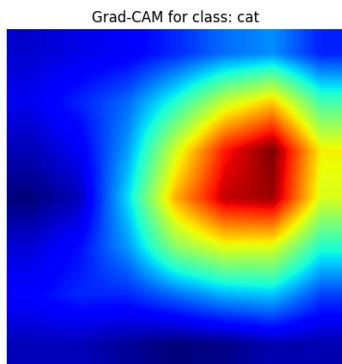

- Feature maps of last conv layer

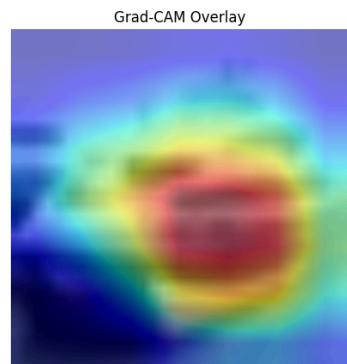

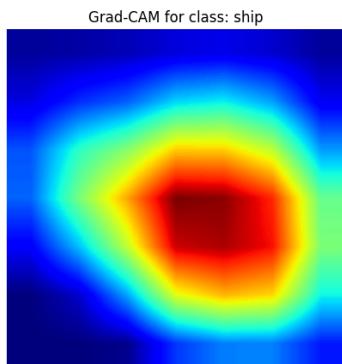

Problem 4:

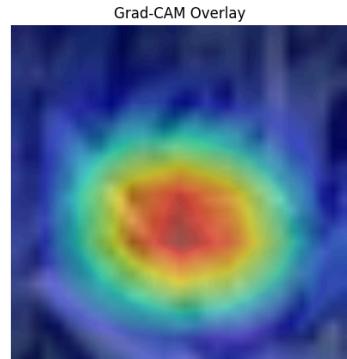

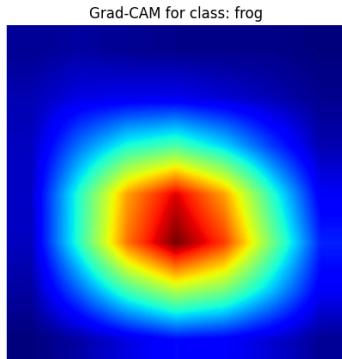

Grad-CAM: Class-Specific Attention Visualization

Grad-CAM: Class-Specific Attention Visualization

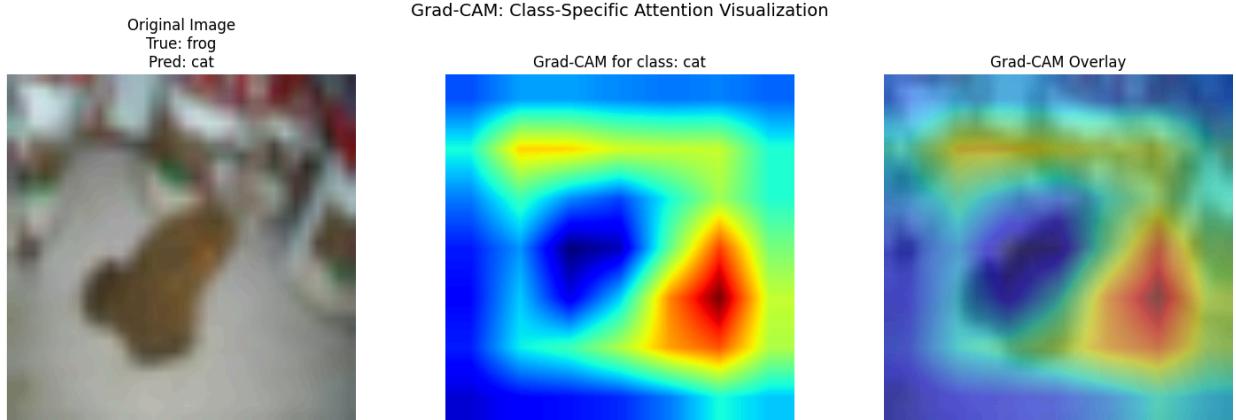

Grad-CAM: Class-Specific Attention Visualization

Interpretation:

The model is correctly “Seeing” the areas where the objects are present and matches perfectly with the human intuition.

Problem 5:

The model is not looking at the object and is focusing on the background which in this case is resembling like a cat and thats why the prediction is wrong.
